

## Optimization Equation

The states included in the optimization problem:

$$\mathbf{x} = \begin{bmatrix} p_n \\ p_e \\ p_d \\ u \\ v \\ w \\ \phi \\ \theta \\ \psi \\ p \\ q \\ r \end{bmatrix}, \quad \mathbf{u} = \begin{bmatrix} \delta_e \\ \delta_a \\ \delta_r \\ \delta_t \end{bmatrix}. \quad (1)$$

## Problem Definition

$$\begin{aligned} \min_{\mathbf{x}} \quad & \Phi = \|\mathbf{c}_d^n - \mathbf{c}^n\| \\ \text{s.t} \quad & \mathbf{Ax} \leq \mathbf{b} \\ & \dot{\mathbf{x}} = f(\mathbf{x}, \mathbf{u}) \end{aligned} \quad (2)$$

where  $f(\mathbf{x}, \mathbf{u})$  represents the aircraft model and  $\mathbf{Ax} \leq \mathbf{b}$  represents the constraints put on the UAV states.  $\Phi$  is the distance between the center point of the camera  $\mathbf{c}^n$  and the ground path that is to be observed  $\mathbf{c}_d^n$ .

## Cost Function

The center point of the camera  $\mathbf{c}^n$  is expressed as a function of the position of the UAV and its attitude states

$$\begin{aligned} \mathbf{c}^n &= \mathbf{p} + \mathbf{c}_b^b \\ &= \begin{bmatrix} p_n \\ p_e \end{bmatrix} + \mathbf{R}_{z,\psi} \begin{bmatrix} p_d \tan(\theta) \\ p_d \tan(\phi) \end{bmatrix}. \end{aligned} \quad (3)$$
